Carnegie Mellon University — B.S., Decision Science, 2016

Skills: ETLWorks, SnapLogic (ETL), SQL Server, Python, JavaScript, REST, AWS S3, Grafana, OpenAI API

Integration Developer, OpenGov, San Francisco, CA — March 2022 – Present

OpenGov is a cloud-based public-sector software platform serving 2,000+ government customers across ERP, reporting, permitting, and a low-code Government App Builder.

Primary technical owner of OpenGov's enterprise ETL infrastructure, serving as the final escalation point for integration-related architectural issues and high-severity outages.

Designs and develops automation across RPA, Python, and AI-assisted workflows (Custom GPTs) to streamline business processes and reduce manual effort.

Drives platform improvements across observability and data pipeline reliability.

Platform Leadership & Architecture

- Led company-wide migration of 1,800+ integrations across 500+ government customers from SnapLogic to ETLWorks, delivering core development in 3 months and enabling a 6-month team migration on time and under budget without external contractors; recognized as Professional Services Person of the Month (July 2024).
- Played a key role in ETL platform selection, conducting proof-of-concept evaluations and guiding final vendor decision-making for ETLWorks adoption.
- Designed scalable shared pipeline architecture and reusable templates supporting B&P integrations across hundreds of customer environments.

Observability, Reliability & Operations

- Resolved recurring SnapLogic stability issues that generated 300+ support tickets per quarter, achieving a 9-month streak with zero crashes and an 80+ hours/quarter efficiency gain, earning the 2022 OpenGov Rockstar Award.
- Engineered an ETLWorks-to-Grafana observability pipeline using webhook-driven execution events, enabling near real-time monitoring, alerting, and incident triage via OpsGenie and Slack.
- Built severity-based alert routing and incident workflows, improving triage speed and reducing noise through deduplication and enriched alert context.
- Developed release-safe backup and rollback infrastructure using S3 and automated pipeline snapshots, ensuring production stability across platform upgrades.
- Delivered customer-facing and internal observability dashboards with integration health metrics and reusable performance tracking frameworks.

Automation, Scale & Platform Efficiency

- Built ETLWorks metadata pipelines to automate large-scale configuration changes and bulk updates, reducing operational effort from 55+ hours to under 1 hour while enabling safe, repeatable deployments.

- Migrated legacy RPA-based automation (Automation Anywhere) to Python-based systems, improving reliability and eliminating ~$150K in projected platform costs over three years.
- Developed end-to-end automation workflows across ETL, APIs, and scheduling systems to streamline integration deployment and maintenance.

AI & Workflow Innovation

- Developed an ETLWorks API layer powering a Custom GPT system that enables internal teams to configure form autofill integrations via natural language, reaching 100+ deployments across 50+ customers.
- Expanded AI-driven workflows into operational tooling, including usage tracking, deployment monitoring, and integration with internal processes and support playbooks.
- Contributed to early-stage AI initiatives integrating LLMs with internal systems (Slack, Jira) to explore real-time support automation and query resolution.

Platform Influence & Cross-Team Impact

- Drove and validated 15+ ETLWorks product improvements by identifying platform gaps, collaborating directly with vendor engineering, and ensuring solutions met production-scale requirements.
- Led cross-functional collaboration across Technical Support, Engineering, and Data Solutions teams to standardize pipelines, improve troubleshooting workflows, and scale platform adoption.
- Authored core documentation and onboarding materials for ETLWorks pipelines and migration processes, enabling faster ramp-up and reduced support overhead.

Integration Specialist, OpenGov, Redwood City, CA July 2017 – February 2022

Built and supported ETL integrations from client ERP systems (e.g., Tyler Technologies, Oracle) into OpenGov's platform using SnapLogic, Scribe, SQL, and Python. As an early team member, delivered customer-specific integrations and developed SQL views reused across implementations.

Client Integration Delivery & Automation

- Delivered complex ETL integrations across 80+ customer implementations, managing 10–15 concurrent projects across diverse ERP systems.
- Built ETL pipelines using SQL, Python, and REST APIs to resolve customer-specific accounting and reporting edge cases.

Major Implementations & Impact

- Led a large-scale ETL initiative for the Oklahoma state government, processing 700,000+ daily records and earning a spot bonus for delivery under strict deadlines.
- Developed Python-based automation pipelines and reporting workflows, improving efficiency and reducing manual effort across implementations.

Data Analyst Intern, Haystagg, Manchester, NH Summer 2016

Programmatic advertising startup that utilized a genetic algorithm to predict Internet users' behavioral patterns primarily for situational targeting in ad campaigns.

Analyzed large-scale datasets (millions of rows) to generate insights for client campaigns and behavioral

modeling, including work for enterprise clients such as William Hill. Built data pipelines and visualizations using SAS and Tableau, and performed segmentation work using logistic regression and K-means clustering.

Business Development Intern, Slydde (acquired by Hooch, Inc.) Summer 2015

Slydde was a mobile app company focused on enhancing the customer experience in bars and restaurants by streamlining the ordering process for drinks and cocktails.

Contributed to product design and research for a mobile app startup, supporting feature development and UX optimization prior to acquisition.

Technology Support Staffer, Osgood Bradley Building Summer 2012, 2013, 2014

The Osgood Bradley Building, an eight-story, 150,000 square foot industrial complex, housed a diverse range of businesses.

Provided IT support across a multi-tenant commercial building, troubleshooting hardware and software issues and maintaining Windows-based systems.

App Developer Intern, Rocket Farm Studios Summer 2011

Rocket Farm Studios, a small mobile strategy and development company, offered me the opportunity to work as an App Developer Intern during the summer before my senior year of high school.

Developed a prototype mobile app (ZipText) using AppInventor, enabling customizable messaging workflows; early exposure to software development.

Additional Academic Work

Teaching Assistant, 88-220 Policy Analysis, CMU Fall 2015

Selected as a Teaching Assistant (TA) for Policy Analysis, a course with a strong emphasis on microeconomics and economic efficiency. As a TA, responsibilities included collaborating closely with fellow masters students, grading papers, meticulously reviewing and proofreading answer keys created by the master's students for accuracy, and occasionally providing support to the professor. This experience allowed for a deepened understanding of microeconomic principles and the development of effective communication and collaboration skills within an academic setting.

Research Assistant, Social and Decision Sciences Department, CMU Spring 2014

Contributed to a research study focused on “Discrepancy Detection as a Measure of Intuitive Performance,” which involved utilizing the Facial Action Coding System (FACS) and managing research participants, collecting data, and organizing and coding data for analysis in Microsoft Excel. Played a pivotal role in the execution of the research project, handling over 125 participants.
